Scaler Waterlines: The Blind Spot in Your Infection Control Protocol

PureClarity™ 

Scaler Waterline Purification System

The New PureClarity Scaler Water Purification System¹ takes any source water and brings it into global compliance by exceeding even the strictest international standards of <100 CFU/ml for at least 6 months² (the current U.S. standard is <500 CFU/ml). Utilizing an innovative biopharmaceutical-grade, asymmetric, microporous membrane, PureClarity filters remove bacteria, pathogens, and contaminants through a chemical-free process.

Key Advantages

Effortless Installation

The filter and "shock syringe" both connect via standard Luer-lock quick-connect fittings, which come preinstalled on most magnetostriuctive and piezo scaler waterlines. Handpiece and air-water syringe tubing can also be easily modified to Luer-lock. Installation requires no opening of junction boxes or accessing internal bottle system components.

Eliminates Compliance Blind Spots

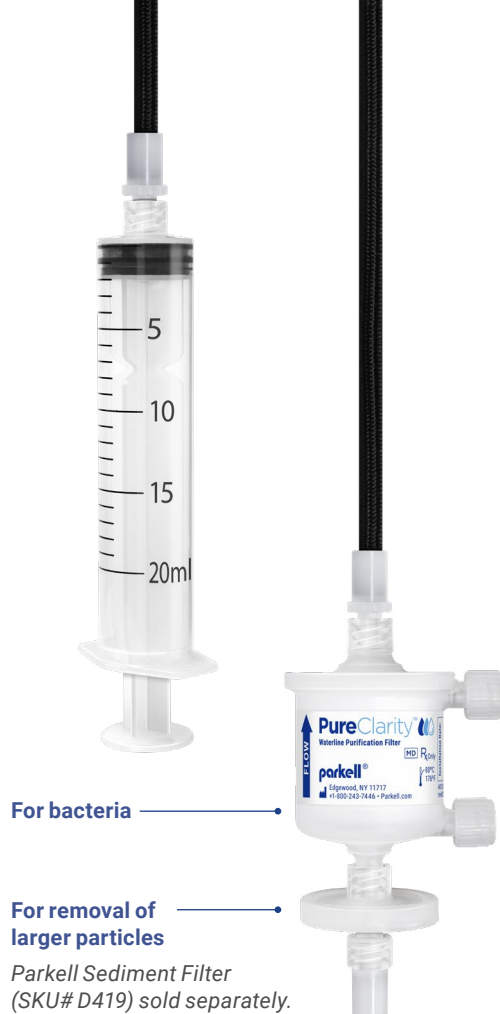

PureClarity provides an easy one-two punch solution for those units still directly connected to municipal water. Shock by loading the included syringe with the manufacturer recommended shock solution. Then protect by affixing the PureClarity filter.

Long-Lasting Purification

PureClarity filters provide clean, safe water for up to 6 months.² To achieve the full useful life of the PureClarity filter, it should be installed in series (downstream from) a Parkell Sediment Filter (which removes any larger debris upstream of the PureClarity filter).

Simplified Shock Protocols

PureClarity filters are designed to target biofilm formation closer to the waterline's endpoint, or point of use. This minimizes the downstream length of waterline beyond the filter, significantly reducing the section requiring testing and shock treatments.

For bacteria

For removal of larger particles

Parkell Sediment Filter (SKU# D419) sold separately.

Shock Then Protect™

Every PureClarity filter comes with a Parkell Shock Syringe¹ for simple loading of shock solutions into any scaler or waterline via Luer-lock connection, thereby simplifying removal of bacterial colonies and biofilm prior to filter installation.¹
