parkell® Procedures

Direct Restorative Workflow

In today's fast-paced practice, workflow optimization is essential for success. With so many different materials available, it can be challenging to find the right mix that work seamlessly together. One solution to this problem is to use products from the same manufacturer.

Fortunately, when it comes to the placement of direct restorations, Parkell has your back! Created for complete compatibility with each other, the products listed below can help streamline the clinical experience for the dentist and improve treatment outcomes for the patient.

STEP 1
Parkell Diamonds

Restorative difficulties often begin with the prep, especially when worn rotary cutting instruments are used over and over, again and again. With a broad range of sizes and grits, Parkell's individually packaged, single patient use, sterile diamonds cut like the first time every time, because you only use them one time! Speed and precision highlight the benefit list of these affordably priced premium cutting instruments.

STEP 2
Etching Gel

Etching Gel is a 37% phosphoric acid gel used for etching enamel and dentin to prepare the tooth surface prior to the application of a bonding agent.

STEP 3
Brush&Bond® MAX

High bond strength and no post-op sensitivity are the top two reasons doctors give for using, and sticking with, Brush&BondMAX. Compatible with all etch techniques as well as all composite types (self-cure, dual-cure, and light-cure), Brush&BondMAX is the ultimate bridge between the tooth and restorative.

STEP 4
Predicta® Bioactive Bulk

Highlighted by its durability, strength, unlimited depth of cure, and capacity to stimulate mineral apatite formation at the material-tooth interphase, this dual-cure bulk-fill offers a basket of features unmatched by any other composite resin.

STEP 5
AccuFilm® FastCheck

A new addition to the AccuFilm product family, FastCheck quickly and easily identifies interferences, especially on newly placed composite. Premounted on an easy-to-hold frame, and only 8 microns, precise occlusal adjustments become commonplace, which helps to expedite the patient dismissal process.

STEP 6
Technical Support (when needed)

When treatment doesn't go as planned, using products from the same manufacturer can simplify the technical support process, as it can be challenging to troubleshoot a problem if you're using products from different companies. Who do you call? When all the products come from the same place, you only need to contact a single technical support team. Parkell boasts a support team whose familiarity with every product can often help identify the root of a stressful situation more quickly.

Parkell's team of direct restorative materials each have a specific role to play, and when used together the result is a winning restoration!
